Abstract

The two of the gene centres, the Mediterranean and the Near East, meet in Turkey, which comprises the Irano-Turanian, Mediterranean and Euro-Siberian phytogeographical divisions. The country is situated on the crossroads of important migratory routes and has been home to several civilizations, later therefore increases in significance. It is accepted as the centre of origin for several plants like pea, wheat, flax, lentil, chickpea, beet, tuberous species, herbaceous species like clover, medics, oats, together with woody species like pistachios, pear, vines, apple, plum and pomegranate. The wheat and barley are said to have been first cultivated in the fertile crescent. Very recent studies have revealed that wheat was cultivated for the first time at Karacadağ and its environs located in Southeastern Anatolia. In this study we have therefore included Diyarbakır, Gaziantep, Kahramanmaraş, Mardin, Şanlıurfa, Adıyaman, Siirt, Şırnak and Hakkari States from the Southeastern Anatolia Region. The plants distributed in the region were evaluated for their role in the food security. The references available on this topic were fully surveyed and current use by the local inhabitants was recorded together with the way they use these species. The plant taxa distributed in the region and their potential as animal feed was evaluated. Generally these belong to the families of Fabaceae and Poaceae. Our investigations showed that the taxa such as *Allium scorodoprasum*, *Anethum graveolens*, *Capparis spinosa* var. *spinosa*, *Crataegus monogyna* ssp. *monogyna*, *Geranium tuberosum*, *Glycyrrhiza glabra*, *Gundelia tournefortii* var. *armata*, *Lepidium sativum* ssp. *sativum*, *Malva sylvestris*, *M. neglecta*, *Mentha pulegium*, *Morus nigra*, *Nasturtium officinale*, *Nigella sativa*, *Olea europaea*, *Orchis coriophora*, *Ornithogalum narbonense*, *Rheum ribes*, *Rhus coriaria*, *Pistacia khinjuk*, *P. vera*, *Portulaca oleracea*, *Rubus sanctus*, *Rumex acetosella*, *R. pulcher*, *Thymbra spicata* var. *spicata*, *Thymus* sp., *Trigonella foenum-graecum*, *Urtica dioica* and *U. urens* are used by the locals as food, in salad and spices, and also consumed as tea. In addition to these, taxa such as *Capparis ovata*, *C. spinosa*, *Cerasus mahaleb*, *Glycyrrhiza glabra*, *Pistacia khinjuk*, *P. terebinthus*, *Rhus coriaria* and *Thymbra spicata* are collected from the wild and sold in the country; also exported. Many taxa distributed in the region are used in the traditional folk medicine. These are given alphabetically with their botanical name, part of the plant that is used, ailment treated and information on the preparations used. The taxa used as dye plants were also recorded. This investigation is expected to serve as a basis for future food security questions in the region.

5.1 Introduction

Turkey is a meeting place of three different plant geographical divisions with varying floral as well as climatic diversity. These phytogeographical regions

are European-Siberian in the north, the Mediterranean in the west and Irano-Turanian in the central and east-south-east regions (Zohary, 1973). This has enabled the development of different

* E-mail: munirozturk@gmail.com

types of ecosystems with different soil and vegetational characteristics (Yiğit *et al.*, 2002; Avcı, 2005; Ozturk *et al.*, 2006a, b; Ozturk *et al.*, 2012c). The country also has two important gene centres of biodiversity with a transition between the Mediterranean, Near East and nine other continental countries (Vavilov, 1951).

The climatic and topographic features across the country have resulted in a remarkable biodiversity. However, the demographic outburst followed by heavy industrialization intensive land use, deforestation, wrong irrigation practices and overgrazing have created a great pressure on its biodiversity (Reynolds and Smith, 2002; Archer, 2004; Wang *et al.*, 2005; Ozturk *et al.*, 2006a, b; Zheng *et al.*, 2006; Xu *et al.*, 2008; Ozturk *et al.*, 2012c). These impacts have lead to the loss and reduction of organic matter in the soil of areas with an arid or semi-arid climate (Perevolotsky and Seligman, 1998; Wallace, 2000; Yates *et al.*, 2000; Tellawi, 2001; Wang, 2003; Yang *et al.*, 2005; Wang *et al.*, 2006a, b; Xu *et al.*, 2008; Jeddi and Chaieb, 2010). Physical and chemical properties of the soil have been degraded as a result of anthropogenic influence, which is closely associated with the vegetation in the area (Ozturk *et al.*, 2006a, b).

Therefore, determination of ecological structure of plant cover in the natural and semi-natural areas and land-use practices carried out on such habitats is of paramount importance in determining the extent of the changes occurring from ecological point of view. Future economical evaluation of these areas is essential for a sustainable future (Karabulut, 2006).

In this chapter, nine states from Southeastern Anatolia – Diyarbakır, Gaziantep, Kahramanmaraş, Mardin, Şanlıurfa, Adıyaman, Siirt, Şırnak and Hakkari – have been included. This area is also known as Upper Mesopotamia, and lately it has come under great pressure due to the construction of dams, highways and other activities (Ozturk *et al.*, 2006a, b; Ozturk *et al.*, 2012c).

The medicinal and economic potential of plants distributed on the dry lands of this area is discussed here in detail in the light of studies undertaken here during the last few decades. Moreover, the evaluation has been considered in the light of future food security and its importance for the region.

5.2 Study Area

The Southeastern Anatolian Region covers an area extending to the southern border of Syria and Iraq,

formed by the chain of south-eastern Taurus mountains. A major part of this area consists of rough plains with a very few mountainous areas (Demir, 2003). Nearly half of the total land in the region is favourable for agricultural production. There is a great difference in the summer and winter temperatures: summers are hot and dry, with an impact from the climatic conditions observed under the Mediterranean precipitation regime. The climate, soils and the vegetation differ from other arid and semi-arid parts of Turkey. In general, the summer temperatures are around 25–30 °C. The average temperature in July is 31 °C in Diyarbakır, 30.4 °C in Siirt, and 27.3 °C in Gaziantep. The highest temperatures are generally above 40 °C (46.2 °C in Diyarbakır, 44 °C in Gaziantep, 46 °C in Siirt). In winter the weather is very cold and frost is common due to the effects of the continental climate. The average January temperature on low plateaus descends to 5 °C and towards the north it drops below 0 °C. The lowest temperatures are around –20 °C due to the continental climatic impacts (–24.2 °C in Diyarbakır, –19.3 °C in Siirt and –17.5 °C in Gaziantep). The temperature goes down to –30 °C on the higher altitudes of Hakkari State. The Southeastern Anatolia Region is under the influence of Mediterranean precipitation regime, with rainy winters and fairly dry summers. The average annual rainfall varies between 400 mm and 1200 mm. The plateaus of Gaziantep and Şanlıurfa, together with Diyarbakır basin, receive a rainfall ranging between 400 mm and 600 mm (549 mm in Gaziantep, 726 mm in Siirt, 491 mm in Diyarbakır), which increases towards the lower parts of Taurus Mountains to 1000 mm. The highest precipitation in the region is recorded in the State of Hakkari, going up to 1000 mm on the southern slopes.

The region enters the Mesopotamian basin in the south, dominated by arid and red-coloured steppe soils, and the amount of lime in the soils is very high due to low rainfall. The area is dominated by plant species of xeric character, except for the higher altitudes of the mountains like Karacadağ, Mazi and Midyat. The steppe vegetation includes the species of Arabian origin. On the edge of steppes, the forests start from 700–850 m, with a domination by shrub such as oak, due to land degradation. Major species found here are *Quercus infectoria*, *Q. brantice* and *Q. libani*. The famous Tigris river occupies the middle of Diyarbakır basin, among the steppes together

with other small and large branches. *Salix triandra* and *Populus euphratica* are distributed all along the two sides of the river.

The presence of *Olea europaea* in the arid steppe parts of the Southeastern Anatolian Region among the general vegetation is highly noteworthy. The olive groves extending to Kilis, Viranşehir and Ceylanpınar. However, due to a very low relative humidity, the plants hold with difficulty. In the western part of the steppe area, especially west of the Euphrates, the vegetation changes and at around 500–600 m, the limestone plateaus are covered by *Olea europaea* and *Pistacia vera* trees. *Pistacia vera* plantations are observed commonly on the plateaus around Gaziantep-Şanlıurfa. From Gaziantep onwards, dry steppes dominate (İnandık, 1965).

In spite of the presence of poor steppe species cover in the Southeastern Anatolia Region, it has a rich diversity of Poaceae and Fabaceae members. Of ten naturally occurring wheat (*Triticum*) cultivars in Turkey, half are found to grow around the Karacadağ area. Fabaceae from the wild species of lentils, vetch, peas, sainfoin and alfalfa from Fabaceae are also distributed in this area. Many species of *Cicer*, *Lens*, *Lathyrus*, *Vicia*, *Pisum*, *Onobrychis*, *Lotus*, *Medicago*, *Trigonella* and *Trifolium* are also commonly seen in Southeastern Anatolia, and some of these are endemic to the region.

Major plant species dominating the steppe vegetation of Southeastern Anatolia are *Acanthophyllum verticillatum*, *Achillea bantolina*, *Alhagi mauro-rum*, *Astragalus gummifer*, *Avena barbata*, *Bromus macrostaphyus*, *Cichorium glandulosum*, *Convolvulus reticulatus*, *Dianthus multipunctatus*, *Delphinium peregrinum*, *Eryngium campestre*, *Euphorbia aleppica*, *Gentiana olivieri*, *Hordeum leporinum*, *Onosma giganteum*, *Silene kotschy*, *Thymus syriacus*, *Trifolium campestre* ile *Centaurea hypericum*, *Trifolium campestre* and different species of *Salvia* and *Verbascum*. The major shrubs found in the region are *Amygdalus arabica*, *Cerasus microcarpa*, *Cercis siliquastrum*, *Ficus caria*, *Acer monspessulanum*, *Cerasus mahalep*, *Crataegus aronica*, *Pyrus syriaca*, *Celtis tournefortii*, *Pistacia khinjuk* and *P. vera*.

5.3 Plant Diversity

The study area has attracted the attention of large number of investigators due to its historical importance. The floristic studies have been undertaken by

Davis (1965 to 1985), Davis *et al.* (1988), Güner *et al.* (2000), Aslan and Türkmen (2001), Aslan and Türkmen (2003), Yıldız (2001), Tatlı *et al.* (2002), Varol (2003), Akan *et al.* (2005a), Aydog˘du and Akan (2005), Aytaç and Duman (2005), Yapıcı and Savaş (2007), Balos and Akan (2008), Eker *et al.* (2008), Atamov *et al.* (2009), Kaya and Ertekin (2009), Özusu and Iskender (2009), Ozusu and Tel (2010), and Ozturk *et al.* (2012c).

An evaluation of the floristic studies has revealed that a total of 3914 vascular plant taxa belonging to 121 families and 793 genera show distribution in the region, including 450 endemics. The families with highest number of taxa are Asteraceae (499 taxa), Fabaceae (467 taxa), Lamiaceae (266 taxa), Brassicaceae (220 taxa) and Poaceae (201 taxa). The genera with highest number of taxa are; *Astragalus* (152 taxa), *Allium* (65 taxa), *Centaurea* (58 taxa), *Trifolium* (55 taxa) and *Silene* (49 taxa) (see Table 5.1).

In addition to the floristic studies many investigations on the forest, steppe, halophytic, ruderal, dry stream, meadow and water-marsh vegetation of this region have also been undertaken (Varol and Tatlı, 2001; Varol and Tatlı, 2002; M. Yavuz, Şanlıurfa'nın Akçakale İlçesi'ndeki halofitik alanların florası ve vejetasyonu. Department of Biology, Institute of Science and Technology, Harran University, 2005, unpublished thesis; Atamov *et al.*, 2006; Varol *et al.*, 2006; Kaya *et al.*, 2009; Kaya, 2010; Kaya *et al.*, 2010; Tel *et al.*, 2010; Yıldırım and Cansaran, 2010; Tel and Tak, 2012; Ozturk *et al.*, 2014). These vegetation studies have revealed that a total of 46 plant associations have been described by the authors cited here. Out of these, the forest vegetation is represented by 17,

Table 5.1. The families and genera in Southeastern Anatolia with the highest numbers of taxa.

	Family	Number of taxa	Genera	Number of taxa
1	Asteraceae	499	<i>Astragalus</i>	152
2	Fabaceae	467	<i>Allium</i>	65
3	Lamiaceae	266	<i>Centaurea</i>	58

steppe by 16, halophytic vegetation by 9, ruderal by 2, dry streams by 1, meadows and water-marsh vegetation by 1 association. These associations are summarized below.

5.3.1 Forest vegetation

Pistacio khyunjuki-Cotinetum coggyriae Tel et al., 2010; *Astragalo lamarckii-Quercetum brantii* Tel et al., 2010; *Lonicero ibericae-Aceretum cinerascens* Tel et al., 2010; *Centaureo lycopifoliae-Pinetum brutiae* Varol and Tatlı, 2001; *Dorcynio hirsuti-Populetum tremulae* Varol and Tatlı, 2001; *Galio tenuissimi-Quercetum cerridis* Varol and Tatlı, 2001; *Potentillo crantzii-Fagetum orientalis* Varol and Tatlı, 2001; *Galio ibicini-Quercetum pinnatilobae* Varol and Tatlı, 2001; *Lagoecio cumioides-Sytracetum officinalii* Varol and Tatlı, 2001; *Thlaspio microstyli-Cedretum libani* Varol and Tatlı, 2001; *Gastridio ventricosi-Pinetum pineae* Varol and Tatlı, 2002; *Medicagini coronatae-Pinetum brutiae* Varol et al., 2006; *Potentillo calycinae-Pinetum brutiae* Varol et al., 2006; *Verbasco amani-Abietum ciliciae* Varol et al., 2006; *Centaureo lycopifoliae-Pinetum pallasianae* Varol et al., 2006; *Nepeto trachionatae-Quercetum brantii* Kaya et al., 2009; *Teucrio multicauli-Crataegium aroniae* Kaya et al., 2009.

5.3.2 Steppe vegetation

Astragalo cuspidipulati-Acantholimetum acerosi Varol and Tatlı, 2001; *Achilleo grandifoliae-Micromerietum brachycalicii* Varol and Tatlı, 2001; *Phlomo lineari-Astragaletum kurdicii* Varol and Tatlı, 2001; *Achilleo pseudoaleppicae-Astragaletum diphtheritae* Kaya, 2010; *Sideritido microchlamydis-Convulvuletum oxysepali* Kaya et al., 2010; *Phlomido capitati-Lagoecietum cominoidis* Tel and Tak, 2012; *Cardo braviphyllaris-Phletum boissierii* Tel and Tak; *Onobrycho caput-galli-Picnometum acarnae* Tel and Tak, 2012; *Salvio palaestinae-Tagrogetum pterocarpi* Tel and Tak, 2012; *Ainsworthio trachycarpae-Elymetum erosiglumis* Tel and Tak, 2012; *Balloto brachyodontae-Stachietum cataonicae* Tel and Tak, 2012; *Phlomido capitati-Picnometum acarnae* Tel and Tak, 2012; *Astragalo compacti-Amygdaletum arabicae* Tel et al., 2010; *Helichryso aucheri-Thymetum kotschyani* Tel et al., 2010; *Verbasco diversifoliae-Astragaletum cephalotis* Tel et al., 2010; *Phlomido capitatae-Thymetum migrici* Tel et al., 2010.

5.3.3 Halophytic vegetation

Haloathamno hierochunticae-Salsoletum incanescens Kaya et al., 2010; *Hymenolobo procumbentis-Aeluropetum lagopoidis* Kaya et al., 2010; *Aeluropuseto lagopoidesae-Chenopodietum vulvariae* Atamov et al., 2006; *Frankenieto pulverulentae-Salsoletum sodae* Atamov et al., 2006; *Cressa creticae-Aeluropuseto lagopoidesae* Atamov et al., 2006; *Prosopo farctae-Hordetum murinumae* Atamov et al., 2006; *Cresso creticae-Hordetum murinumae* Atamov et al., 2006; *Alhago manniferae-Hordetum murinumae* Atamov et al., 2006; *Ammio visnagae-Hordetum murinumae* Atamov et al., 2006.

5.3.4 Ruderal vegetation

Frankenio pulverulentae-Chenopodietum albi Kaya et al., 2010; *Prosopo farctae-Alhagietum manniferae* Kaya et al., 2010.

5.3.5 Dry stream vegetation

Acantho dioscoridi-Vitacetum agni-casti Kaya et al., 2009

5.3.6 Meadows and water-marsh vegetation

Phragmitetum australisae Koch 1926

5.4 Economically Important Vascular Plants in Southeastern Anatolia

The plants in this region have been used as potential forage crops, food plants, for medicinal purposes, fuel, dye, basket making and other handicrafts, such as musical instrument making, as well as ornaments by different civilizations throughout history (Ozturk and Ozelik, 1991; Plotkin, 2000; Ozturk et al., 2011; Ozturk et al., 2012a, b). The ethnobotanical studies published from the region indicate that 367 taxa have been evaluated as medicinals and aromatics, 225 taxa as food plants, 156 taxa as fodder, 19 taxa as herbal drinks, 19 taxa as spices, and 25 taxa in cheese making. In addition to these, nearly 159 taxa have been used for other economic purposes (fuel, ornaments, dye, musical instruments, handicrafts, brooms, baskets, toys) (see Fig 5.1). These studies reveal that the most widely used form is for medicinal and aromatic purposes (38%), followed by food plants

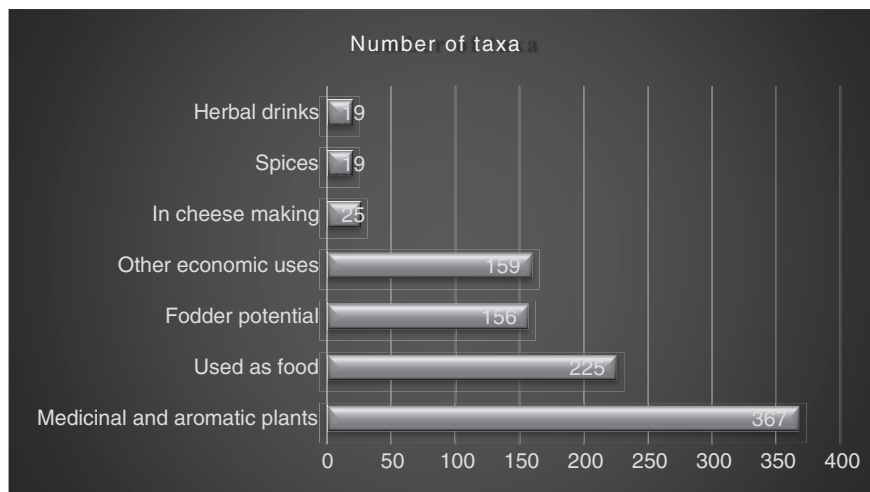

Fig. 5.1. The distribution pattern of ethnobotanical uses of plant taxa from Southeastern Anatolia.

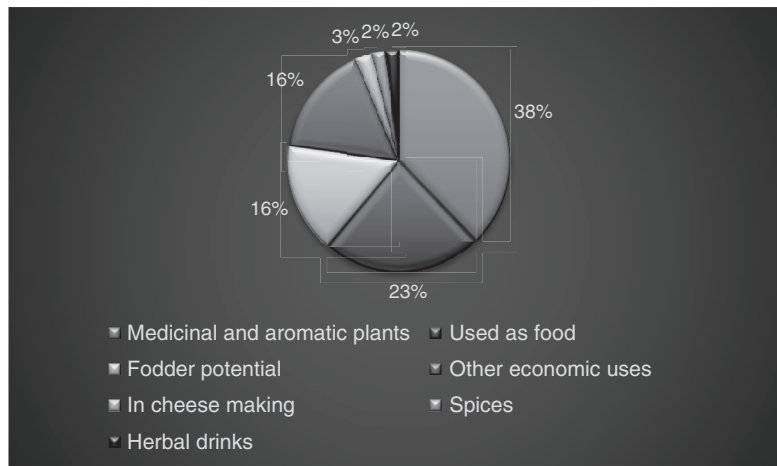

Fig. 5.2. The distribution pattern of ethnobotanical uses of plant taxa from Southeastern Anatolia on percentage basis.

(23%), fodder species (16%) and other economic uses (16%) (see Fig 5.2).

5.5 Medicinal and Aromatic Plants in Southeastern Anatolia

An evaluation of the ethnobotanical uses highlights the fact that people in this region have been using the plants as a major source for the treatment of diseases, as in other parts of the world (Blumenthal, 1998; Plotkin, 2000; Kurt *et al.*, 2004; Algier *et al.*, 2005; Newman and Cragg,

2007; Kendir and Güvenç, 2010; Ozturk *et al.*, 2011; Pleskanovskaja *et al.*, 2011; Ozturk *et al.*, 2012a, b; Ozturk *et al.*, 2014). This type of use dates back thousands of years (De Silva *et al.*, 2009). In all, 367 medicinal and aromatic plant taxa have been reported from the study area. These are given alphabetically with their botanical name, part used, ailment treated and information on the preparations used (see Table 5.2).

An evaluation of these on the basis of disease shows that a large number of taxa are used for urinary system disorders (108 taxa), followed by stomach

Table 5.2. List of medicinal and aromatic plants distributed in Southeastern Anatolia.

(101 taxa) and respiratory disorders (84 taxa) (see Fig 5.3). On the basis of parts used, mainly aerial parts are used (100 taxa), leaves (84 taxa) and flowers (71 taxa) (see Fig 5.4). The most common preparation methods are boiled (20%), followed by infusion (18%), raw (11%) and decoction (10%). Other uses and their percentages are given in Fig 5.5.

5.6 Plants Consumed as Source of Food

Lately with an understanding of the use of synthetic foods as a cause of obesity, people have started going back to natural plant foods. These have become an indispensable part of daily human nutrition, because of their richness in minerals, fibre

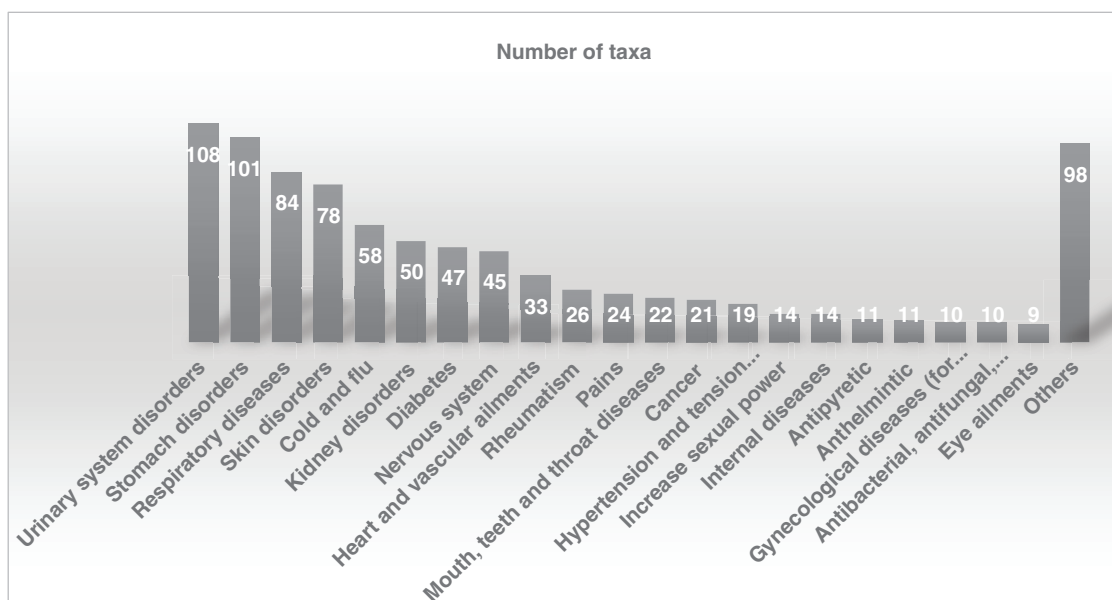

Fig. 5.3. Therapeutic uses of the medicinal and aromatic plants in Southeast Anatolia

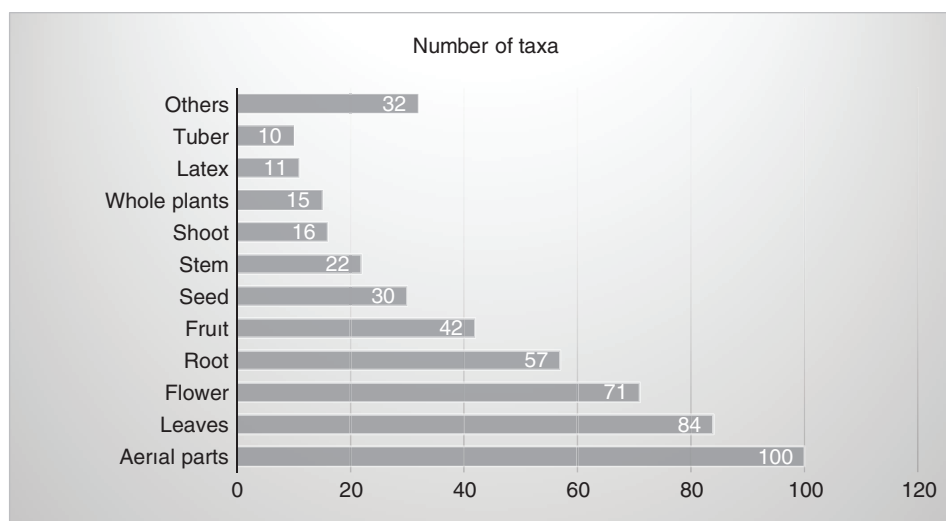

Fig. 5.4. The parts of the medicinal and aromatic plants used in Southeastern Anatolia.

Fig. 5.5. The percentages of the preparations used in the traditional folk medicine.

and vitamins (Tukan *et al.*, 1998). The collection and use of plants as food in Turkey is a very old custom (Ozturk and Ozcelik, 1991; Ozturk *et al.*, 2012a). The people have been trying to satisfy their feeding needs by collecting plants from their surrounding mountains and forests. This tradition still continues in rural areas (Ozturk *et al.*, 2011; Ozturk *et al.*, 2012a, b), and is especially common in Southeastern Anatolia (Ozturk and Ozcelik, 1991; Ozturk *et al.*, 2014). In the light of studies undertaken in this region, a total of 225 taxa have been recorded as being used as food plants (see Table 5.3). On the basis of consumption of plant parts, mainly fruits have been used (61 taxa), followed by aerial parts (49 taxa) and leaves (44 taxa). Other current uses are given in Fig. 5.6. These are consumed as raw (63.71%) or cooked (30.24%). Other types of consumption are boiled (2.02%), as gum (2.02%), as nectar (1.61%) and latex (0.4%).

The plants consumed in daily use as foods are collected during the appropriate seasons and sold at the local markets (Surmeli *et al.*, 2001). These plants include taxa such as *Capparis ovata*, *C. spinosa*, *Cerasus mahaleb*, *Glycyrrhiza glabra*, *Pistacia khinjuk*, *P. terebinthus*, *Rhus coriaria* and *Thymbra spicata*. Some of these are also exported. Although the use as food plants varies from state to state, a large number of these are also used as spices and as flavouring agents in cheese making or as herbal drinks. The plants used as spices include 19 taxa

(see Table 5.4); 25 taxa in cheese making (see Table 5.5), and 13 taxa as herbal teas (see Table 5.6).

In addition to the teas prepared from different plant taxa (Ozturk *et al.*, 2011), special coffees are prepared from the fruits of *Pistacia khinjuk* (Akan *et al.*, 2005b) and *P. terebinthus* (A. Gençay, Cizre (Şırnak)'nin etnobotanik özellikleri. Department of Biology, Institute of Science and Technology, Yüzüncü Yıl University, 2007, unpublished thesis; A. Gelse, Adıyaman çevresinin etnobotanik özellikleri [Ethnobotanical Properties of the Adıyaman Environment]. Department of Biology, Institute of Science and Technology, Yüzüncü Yıl University, 2012, unpublished thesis), the seeds of *Ricinus communis* (İ. Kaval, Geçitli (Hakkari) ve çevresinin etnobotanik özellikleri. Department of Biology, Institute of Science and Technology, Yüzüncü Yıl University, 2011, unpublished thesis). The fruit juices of *Morus nigra* and *Punica granatum* (A. Gelse, Adıyaman çevresinin etnobotanik özellikleri [Ethnobotanical Properties of the Adıyaman Environment]. Department of Biology, Institute of Science and Technology, Yüzüncü Yıl University, 2012, unpublished thesis) are sold commonly, together with the syrup prepared from the roots of *Glycyrrhiza glabra* (Akan *et al.*, 2005b; A. Gelse, Adıyaman çevresinin etnobotanik özellikleri [Ethnobotanical Properties of the Adıyaman Environment]. Department of Biology, Institute of Science and Technology, Yüzüncü Yıl University, 2012, unpublished thesis).

5.7 Plants Used as Fodder in Southeastern Anatolia

Meadows and pastures are an important genetic source for cultivated plants, contribute much to biological diversity, serve as the areas of shelter for animals, and shield land from erosion, in addition to serving as the most important natural sources of forage plants for animals (Aydın and Uzun, 2002; Ozturk *et al.*, 2012c). These habitats are also very important as a cheaper feed-source for animal nutrition and animal health in terms of the quality of animal products. Therefore, pasture and meadow areas and their efficiency is of paramount

importance (Kaya *et al.*, 2001; Babalık and Sönmez, 2009).

Harlan (1983) has separated the fodder plants into four geographical regions. He has reported that Turkey includes three of these regions: Europe, Mediterranean and Middle East. He reports that the some of the species of *Lolium*, *Trifolium*, *Medicago*, *Dactylis*, *Festuca*, *Avena*, *Phleum*, *Lupinus* are spread out in the centre of Europe, whereas some species of *Dactylis*, *Festuca*, *Avena*, *Phleum*, *Lupinus* are from the Mediterranean and some species of *Trifolium*, *Medicago*, *Onobrychis*, *Agropyron*, *Festuca*, *Bromus* from the Middle East.

Turkey is known as the first cultivation centre of Leguminosae members like *Vicia*, *Pisum*, *Lupinus*, and *Lens* (Harlan, 1971; Zohary and Hopf, 1994; Ozturk *et al.*, 2012d). *Hordeum spontaneum* is believed to be the ancestor of barley, *Avena strigosa* the ancestor of oats, and *Secale anatolicum*, *S. montanum* and *S. segatale* the ancestors of rye. *Lens orientalis* is the ancestor of lentil, *Vicia galilae* the ancestor of beans, *Pisum elatius* and *P. humile* are ancestors of pea. These have all spread across Anatolia. Şanlıurfa and its environs are known as

the gene resource of plants, especially of wheat (*Triticum*) and lentil (*Lens*) (Ekim, 1994; Cevheri and Çetin, 2010).

In this context, and in the light of studies conducted in the region, Southeastern Anatolia shows a potential spread of fodder plants with a total of 156 taxa (see Table 5.7). Nearly 50% of (78 taxa) these taxa belong to the Fabaceae family including 15, 13, 10, 7, 7, 6 and 6 taxa respectively from *Trifolium*, *Vicia*, *Medicago*, *Lathyrus*, *Trigonella*, *Astragalus* and *Onobrychis*.

5.8 Other Economic Plants Used in Southeastern Anatolia

Apart from the uses given above, plants in the region are also used in basket making, toys, brooms, musical instruments, handicrafts, in house constructions, decorations, as natural dyes, and as fuel. A total of 159 taxa are used for this purpose (see Table 5.8).

The majority are used as fuel (49 taxa: 22.38%), or as ornaments (35 taxa: 15.98%), followed by handicrafts (35 taxa: 15.98%) (see Fig 5.7). The number of taxa and their percentages in the production of dyes is 27 taxa (12.33%), musical instruments 25 taxa (11.42%), brooms 15 taxa (6.85%) (see Fig 5.7).

Trigonella monantha ssp. *noeana*, *Ballota saxalis* ssp. *saxalis*, *Cyclotrichum leucotrichum*, *Matricaria aurea* and *Parietaria judaica* are used as aromatic plants; *Ammi visnaga*, *Verbascum orientale* and *Verbascum kotschyi* as insecticides; *Pistacia terebinthus* ssp. *palaestina* and *Pistacia khinjuk* in soap making; *Ammi visnaga* (A. Gelse, Adıyaman çevresinin etnobotanik özellikleri [Ethnobotanical Properties of the Adıyaman Environment]. Department of Biology, Institute of Science and Technology, Yüzüncü Yıl University, 2012, unpublished thesis) and *Daucus littoralis* in making tooth picks; *Alcea hohenackeri* as deter-

gent; *Cyperus longus* for rope and *Eremurus spectabilis* for gum production (Akan *et al.*, 2005b; A. Gençay, Cizre (Şırnak)'nın etnobotanik özellikleri. Department of Biology, Institute of Science and Technology, Yüzüncü Yıl University, 2007, unpublished thesis; Akan *et al.*, 2008; N. Gölbaş, Adıyaman İlinde etnobotanik değeri olan bazı bitkilerin kullanım alanlarının tespiti. Department of Biology, Institute of Science and Technology, Fırat University, 2009, unpublished thesis; İ. Kaval, Geçitli (Hakkari) ve çevresinin etnobotanik özellikleri. Department of Biology, Institute of Science and Technology, Yüzüncü Yıl University, 2011, unpublished thesis; A. Akgül, Midyat (Mardin) civarında etnobotanik. Graduate School of Science, Ege University, İzmir, Turkey, 2008, unpublished thesis). The total percentage of these uses in general does not go beyond 6.37%. Photographs of some of the representative medicinal plants and other aspects can be found in Fig. 5.8.

5.9 Conclusions

A determination of the drought-tolerant plant species which will be suitable for dry conditions in the future needs to be considered for food security (Ozturk *et al.*, 2011; Ozturk *et al.*, 2012a, b, c). Ecological sustainability is another important factor,

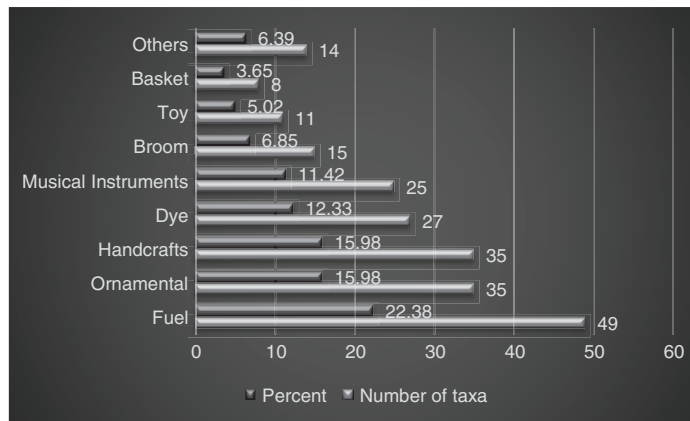

Fig. 5.7. Number and percentages of Southeastern Anatolian plant taxa with other economic uses.

Fig. 5.8. Some commonly used medicinal plants from the study area: 1. *Achillea bieberstenii*; 2. *Hypericum capitatum* var. *capitatum*; 3. *Salvia syriaca*; 4. *Anthemis tinctoria*; 5. *Cichorium intybus*; 6. *Bellis perennis*; 7. *Glycyrrhiza glabra* var. *glandulifera*; 8. *Hypericum perforatum*; 9. *Myrtus communis*; 10. *Pistacia terebinthus* ssp. *palaestina*; 11. *Viscum album*; 12. *Thymra spicata*.

especially for medicinal, aromatic and other economically important plants. It is not possible to place a price on these, but they have great economic value (Costanza and Farber, 2002; Farber *et al.*, 2006). The use of such plants in agricultural activities carries great weight for humans as well as domesticated animals, in particular because both south-west Asia and Turkey are gene centres of these plants; therefore it is imperative to identify these taxa. Conservation of the economically important medicinal and other plants in this context is also high priority. It is necessary during conservation to look at how these plants are utilized by local people. A protection of genetic resources in Turkey is perhaps the highest priority (Pleskanovskaja *et al.*, 2011).

The laws for 'nature and species protection' cannot be applied effectively unless alternatives are developed for collecting plants from nature. The best option in this connection is to employ cultivation practices for such plants. Endangered species and those threatened with extinction should be considered in terms of their contribution to the natural environment and the economy of the country. A sustainable conservation of genetic resources from our natural wealth and for future research is also very important (Bayram *et al.*, 2010).

For medicinal and aromatic plants, as well as other plants of economic importance for relevant stakeholders and industry, a long-term plan is a pre-requisite. For economically important plants, it is essential that we study their behaviour under future climate-change scenarios, together with drought, flooding, erosion, other natural disasters, ecosystem viability and sustainable land management. We must work on the market preferences and demand trends of genetic resources and biodiversity, their varietal development, organic products, the planning related to their production based on industry issues. There is also a need to create research inventories and collaboration platforms. In addition, each organization needs close cooperation and communication among themselves as well as with the local inhabitants (Bayram *et al.*, 2010).

The world today is facing the crisis of antibiotic-resistant strains of viruses. The major hindrance for herbal therapies is the lack of amalgamation of indigenous knowledge with modern medical practices, because little or no scientific data is available regarding the safety and efficacy of the herbal drugs. There is an urgent need to document and authenticate the available indigenous knowledge with modern scientific principles.

During the next 50 years, the global population is expected to reach a level of 9 billion. This will lead to a decrease in renewable natural resources. Housing and farmland use will increase, leading towards to a decrease in the number of species. The area of fertile soils will dwindle and deforestation will add to the species loss. Climate change will add to this loss with a depletion of water resources. Undoubtedly all of these factors will pose great threats for future generations (Pleskanovskaja *et al.*, 2011). Out of our natural resources, in particular, availability of medicinal and aromatic plants together with other consumable herbals will suffer greater loss (Ozturk *et al.*, 2011; Ozturk *et al.*, 2012a, b, c).
